List of New Features

The following table outlines the functional behaviors implemented and tested during Milestone 4. Each feature is associated with a completed Trello card that tracks progress, attachments, and acceptance testing documentation.

Table 1

New Features Implemented in Milestone 4

Feature	Description	Related Trello Card
Customer Login and Authentication	Allows secure login with validation for correct and incorrect credentials	R_1: User Authentication
Item Scanning and Cart View	Scanned items are displayed in the cart with name, quantity, and price	R_4: Add Items via Barcode
Receipt Options	Enables customers to choose between print, email, or no receipt at checkout	R_13: Receipt Option Selection
Assistance Request System	Allows customers to call for help, sending an alert to the attendant dashboard	R_9: Assistance Call Button
Attendant Override Functionality	Attendant can override rejected coupons or items from their dashboard	R_10: Attendant Override
Attendant Login Security	Ensures only authorized attendants can access the management dashboard	R_15: Attendant Login Screen

List of Known Issues

The following table lists any features or issues that are either incomplete, deferred for future sprints, or identified during testing.

Table 2
Known Issues Documented in Milestone 4

Issue	Description	Trello Issue Card
Payment Gateway Simulation Placeholder	No real payment simulation implemented; ATP used mock steps for checkout	“Payment Gateway Simulation Placeholder”

UI Transitions/Accessibility Enhancements	UI lacks transitions and accessibility compliance in some views	“UI Transition/Accessibility Enhancements”
--------------------------------------------------	-----------------------------------------------------------------	--------------------------------------------

Version Identification

This project is being managed locally with version tracking maintained through Trello. Each functional requirement and issue is represented by a card on the Trello board and marked by milestone labels. The most recent version of the project delivery corresponds with **Milestone 4** and includes completed cards for acceptance-tested features.

Since no Git repository is being used, versioning is based on:

- **Milestone labeling** within Trello (e.g., “Milestone 4” tag)

- Checklist completion status
- Attachment of wireframes and acceptance test procedures
- Timestamped card activity logs

Agile Strategy for Managing Task Overload

To avoid taking on more tasks than can be completed in a sprint, I use **sprint planning** and **backlog grooming** practices in Trello. I assign each card a **Milestone label** and **effort estimate** using checklist subtasks. By moving only a limited number of cards into “In Progress,” I ensure that the workload stays manageable.

If additional issues come up during a sprint (like new bugs or requirement gaps), I document them in the backlog but defer them to the next sprint unless they are critical to current delivery. This helps maintain focus and avoid scope creep.
